Amazon EC2 instance types

End of sale notice

The **U-9tb1**, **U-12tb1**, **U-18tb1**, and **U-24tb1** instance types are no longer available for new instance launches. If your workload requires a high-memory instance, we recommend that you use a U7i instance type instead.

When you launch an EC2 instance, the *instance type* that you specify determines the hardware of the host computer used for your instance. Each instance type offers different compute, memory, and storage capabilities, and is grouped in an instance family based on these capabilities. Select an instance type based on the requirements of the application or software that you plan to run on your instance.

Amazon EC2 dedicates some resources of the host computer, such as CPU, memory, and instance storage, to a particular instance. Amazon EC2 shares other resources of the host computer, such as the network and the disk subsystem, among instances. If each instance on a host computer tries to use as much of one of these shared resources as possible, each receives an equal share of that resource. However, when a resource is underused, an instance can consume a higher share of that resource while it's available.

Each instance type provides higher or lower minimum performance from a shared resource. For example, instance types with high I/O performance have a larger allocation of shared resources. Allocating a larger share of shared resources also reduces the variance of I/O performance. For most applications, moderate I/O performance is more than enough. However, for applications that require greater or more consistent I/O performance, consider an instance type with higher I/O performance.

Previous generation instances

Amazon Web Services offers previous generation instance types for users who have optimized their applications around them and have yet to upgrade. We encourage you to use current generation instance types to get the best performance, but we continue to support the following previous generation instance types. For more information about which current generation instance type would be a suitable upgrade, see [Previous Generation Instances](#).

- **Memory optimized:** R3 | R4
- **Storage optimized:** I2
- **Accelerated computing:** G3 | P3 | P3dn

Instance performance

Fixed performance instances

Fixed performance instances provide fixed CPU resources. These instances can deliver and sustain full CPU performance at any time, and for as long as a workload needs it. If you need consistently high CPU performance for applications such as video encoding, high volume websites, or HPC applications, we recommend that you use fixed performance instances.

Burstable performance instances

Burstable performance (T) instances provide a baseline level of CPU performance with the ability to burst above the baseline. The baseline CPU is designed to meet the needs of the majority of general purpose workloads, such as large-scale micro-services, web servers, small and medium databases, data logging, code repositories, virtual desktops, and development and test environments.

The baseline utilization and ability to burst are governed by CPU credits. Each burstable performance instance continuously earns credits when it stays below the CPU baseline, and continuously spends credits when it bursts above the baseline. For more information, see [Burstable performance instances](#) in the *Amazon EC2 User Guide*.

Flex instances

C7i-flex, C8i-flex, M7i-flex, M8i-flex, R8i-flex instances offer a balance of compute, memory, and network resources, and they provide the most cost-effective way to run a broad spectrum of general purpose applications. These instances provide reliable CPU resources to deliver a baseline CPU performance of 40 percent, which is designed to meet the compute requirements for a majority of general purpose workloads. When more performance is needed, these instances provide the ability to exceed the baseline CPU performance and deliver up to 100 percent CPU performance for 95 percent of the time over a 24-hour window.

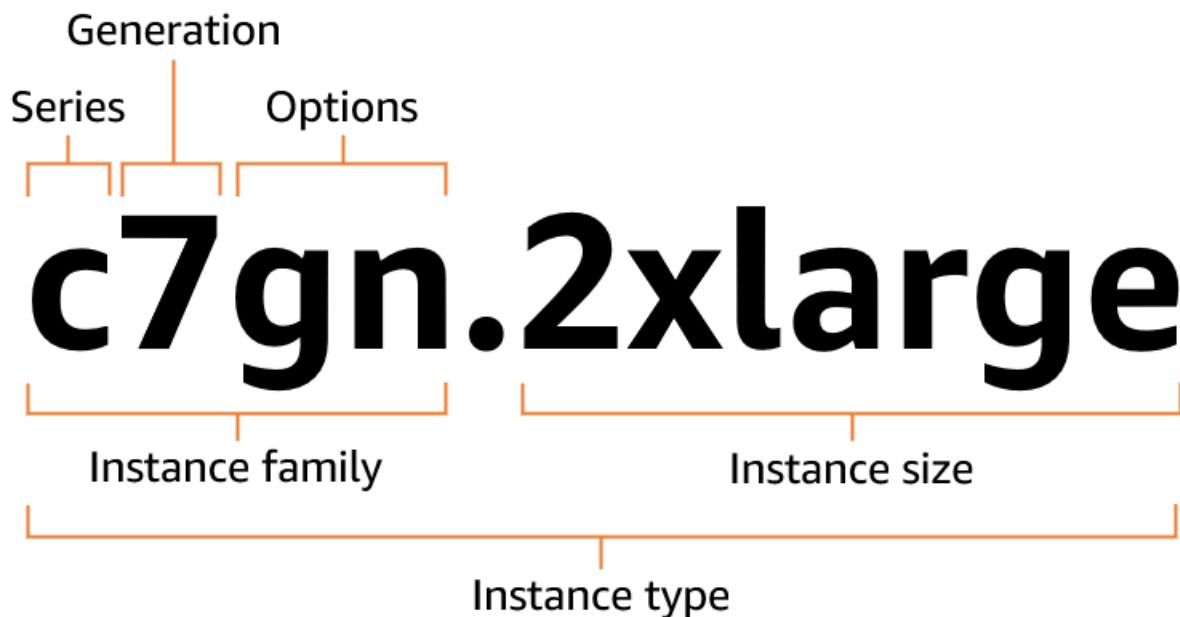

Flex instances running at a high CPU utilization that is consistently above the baseline for long periods of time might see a gradual reduction in the maximum burst CPU throughput. For more information, see the following:

Amazon EC2 instance type naming conventions

Amazon EC2 provides a variety of instance types so you can choose the type that best meets your requirements. Instance types are named based on their *instance family* and *instance size*. The first position of the instance family indicates the *series*, for example c. The second position indicates the *generation*, for example 7. The third position indicates the *options*, for example gn. After the period (.) is the instance size, such as small or 4xlarge, or metal for bare metal instances.

Amazon EC2 instance type specifications

Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instance types comprise varying combinations of CPU, memory, storage, and networking capacity and give you the flexibility to choose the appropriate mix of resources for your applications. Each instance type includes one or more instance sizes, allowing you to scale your resources to the requirements of your target workload.

We group EC2 instance into the following categories:

- **General purpose** – Provide a balance of compute, memory, and networking resources. These instances are ideal for applications that use these resources in equal proportions, such as web servers and code repositories.
- **Burstable performance** – The T instance family is also referred to as burstable performance instances. These instances provide a baseline CPU performance with the ability to burst above the baseline at any time. For more information, see [Burstable performance instances](#) in the *Amazon EC2 User Guide*.
- **Compute optimized** – Designed for compute intensive applications that benefit from high performance processors. These instances are ideal for batch processing workloads, media transcoding, high performance web servers, high performance computing (HPC), scientific modeling, dedicated gaming servers, ad server engines, and machine learning inference.
- **Memory optimized** – Designed to deliver fast performance for workloads that process large data sets in memory.
- **Storage optimized** – Designed for workloads that require high, sequential read and write access to very large data sets on local storage. They are optimized to deliver tens of thousands of low-latency, random I/O operations per second (IOPS) to applications.
- **Accelerated computing** – Use hardware accelerators, or co-processors, to perform functions, such as floating point number calculations, graphics processing, or data pattern matching, more efficiently than is possible in software running on CPUs.
- **High-performance computing** – Purpose built to offer the best price performance for running HPC workloads at scale on AWS. These instances are ideal for applications that benefit from high-performance processors, such as large, complex simulations and deep learning workloads.
- **Previous generation** – AWS offers previous generation instance types for users who have optimized their applications around them and have yet to upgrade. We encourage you to use

current generation instance types to get the best performance, but we continue to support previous generation instance types.

To determine which instance types meet your requirements, such as supported Regions, compute resources, or storage resources, see [Find an Amazon EC2 instance type](#) in the *Amazon EC2 User Guide*.

 **Note**

¹ These are burstable instance types that provide a baseline CPU performance with the ability to burst beyond their baseline at any time using CPU credits. For more information, see [Burstable performance instances](#).

Network specifications

Note

M8a, M8g, M8gd, M8i, M8i-flex instance types support configurable bandwidth weightings. With these instance types, you can optimize an instance's bandwidth for either networking performance or Amazon EBS performance. The following table shows the default networking bandwidth performance for these instance types. For the supported configurable weightings, see [Configurable bandwidth weighting preferences](#).

Note

¹ These instances have a baseline bandwidth and can use a network I/O credit mechanism to burst beyond their baseline bandwidth on a best effort basis. Other instance types can sustain their maximum performance indefinitely. For more information, see [instance network bandwidth](#).

For m6in.32xlarge, m6in.metal, m6idn.32xlarge, m6idn.metal, you must attach at least 2 ENIs, to separate network cards, to achieve 200 Gbps throughput. Each ENI attached to a network card can achieve up to 170 Gbps.

Amazon EBS specifications

The following table indicates which instance types are Amazon EBS optimized by default and which optionally support it. It also describes their EBS-optimized performance, including dedicated bandwidth to Amazon EBS, the typical maximum aggregate throughput that can be achieved on that dedicated connection with a streaming read workload and 128 KiB I/O size, and the maximum IOPS the instance type can support when using a 16 KiB I/O size. Instance types not listed do not support Amazon EBS optimization.

Important

An instance's EBS performance is bounded by the instance's performance limits, or the aggregated performance of its attached volumes, whichever is smaller. To achieve maximum EBS performance, an instance must have attached volumes that provide a combined performance equal to or greater than the maximum instance performance. For example, to achieve 80,000 IOPS for r6i.16xlarge, the instance must have at least 5

gp3 volumes provisioned with 16,000 IOPS each (5 volumes x 16,000 IOPS = 80,000 IOPS).

We recommend that you choose an EBS-optimized instance type that provides more dedicated Amazon EBS throughput than your application needs; otherwise, the connection between Amazon EBS and Amazon EC2 can become a performance bottleneck.

Note

M8a, M8g, M8gd, M8i, M8i-flex instance types support configurable bandwidth weightings. With these instance types, you can optimize an instance's bandwidth for either networking performance or Amazon EBS performance. The following table shows the default networking bandwidth performance for these instance types. For the supported configurable weightings, see [Configurable bandwidth weighting preferences](#).

 **Note**

¹ These instances can support maximum performance for 30 minutes at least once every 24 hours, after which they revert to their baseline performance. Other instances can sustain the maximum performance indefinitely. If your workload requires sustained maximum performance for longer than 30 minutes, use one of these instances.

Specifications for Amazon EC2 compute optimized instances

Compute optimized instances are designed for compute intensive applications that benefit from high performance processors. These instances are ideal for batch processing workloads, media transcoding, high performance web servers, high performance computing (HPC), scientific modeling, dedicated gaming servers, ad server engines, and machine learning inference.

For information on previous generation instance types of this category, such as C4 instances, see [Specifications for Amazon EC2 previous generation instances](#).

Network specifications

 **Note**

C8a, C8g, C8gd, C8i, C8i-flex instance types support configurable bandwidth weightings. With these instance types, you can optimize an instance's bandwidth for either networking performance or Amazon EBS performance. The following table shows the default networking bandwidth performance for these instance types. For the supported configurable weightings, see [Configurable bandwidth weighting preferences](#).

Note

¹ These instances have a baseline bandwidth and can use a network I/O credit mechanism to burst beyond their baseline bandwidth on a best effort basis. Other instance types can sustain their maximum performance indefinitely. For more information, see [instance network bandwidth](#).

For c6in.32xlarge, c6in.metal, you must attach at least 2 ENIs, to separate network cards, to achieve 200 Gbps throughput. Each ENI attached to a network card can achieve up to 170 Gbps.

For c8gn.48xlarge, c8gn.metal-48x1, you must attach at least 2 ENIs, to separate network cards, to achieve 600 Gbps throughput. Each ENI attached to a network card can achieve up to 300 Gbps.

Amazon EBS specifications

The following table indicates which instance types are Amazon EBS optimized by default and which optionally support it. It also describes their EBS-optimized performance, including dedicated bandwidth to Amazon EBS, the typical maximum aggregate throughput that can be achieved on that dedicated connection with a streaming read workload and 128 KiB I/O size, and the maximum IOPS the instance type can support when using a 16 KiB I/O size. Instance types not listed do not support Amazon EBS optimization.

Important

An instance's EBS performance is bounded by the instance's performance limits, or the aggregated performance of its attached volumes, whichever is smaller. To achieve maximum EBS performance, an instance must have attached volumes that provide a combined performance equal to or greater than the maximum instance performance. For example, to achieve 80,000 IOPS for r6i.16xlarge, the instance must have at least 5 gp3 volumes provisioned with 16,000 IOPS each (5 volumes x 16,000 IOPS = 80,000 IOPS).

We recommend that you choose an EBS-optimized instance type that provides more dedicated Amazon EBS throughput than your application needs; otherwise, the connection between Amazon EBS and Amazon EC2 can become a performance bottleneck.

 **Note**

C8a, C8g, C8gd, C8i, C8i-flex instance types support configurable bandwidth weightings. With these instance types, you can optimize an instance's bandwidth for either networking performance or Amazon EBS performance. The following table shows the default networking bandwidth performance for these instance types. For the supported configurable weightings, see [Configurable bandwidth weighting preferences](#).

 **Note**

¹ These instances can support maximum performance for 30 minutes at least once every 24 hours, after which they revert to their baseline performance. Other instances can sustain the maximum performance indefinitely. If your workload requires sustained maximum performance for longer than 30 minutes, use one of these instances.

Specifications for Amazon EC2 memory optimized instances

⚠ **End of sale notice**

The **U-9tb1**, **U-12tb1**, **U-18tb1**, and **U-24tb1** instance types are no longer available for new instance launches. If your workload requires a high-memory instance, we recommend that you use a U7i instance type instead.

Memory optimized instances are designed to deliver fast performance for workloads that process large data sets in memory.

For information on previous generation instance types of this category, such as R4 instances, see [Specifications for Amazon EC2 previous generation instances](#).

Network specifications

 **Note**

R8a, R8g, R8gd, R8i, R8i-flex, X8g, X8aedz instance types support configurable bandwidth weightings. With these instance types, you can optimize an instance's bandwidth for either networking performance or Amazon EBS performance. The following table shows the default networking bandwidth performance for these instance types. For the supported configurable weightings, see [Configurable bandwidth weighting preferences](#).

Note

¹ These instances have a baseline bandwidth and can use a network I/O credit mechanism to burst beyond their baseline bandwidth on a best effort basis. Other instance types can sustain their maximum performance indefinitely. For more information, see [instance network bandwidth](#).

For `r6in.32xlarge`, `r6in.metal`, `r6idn.32xlarge`, `r6idn.metal`, you must attach at least 2 ENIs, to separate network cards, to achieve 200 Gbps throughput. Each ENI attached to a network card can achieve up to 170 Gbps.

For `u7in-16tb.224xlarge`, `u7in-24tb.224xlarge`, `u7in-32tb.224xlarge`, `u7inh-32tb.480xlarge`, you must attach at least 2 ENIs, to separate network cards, to achieve 200 Gbps throughput. Each ENI attached to a network card can achieve up to 100 Gbps.

For `r8gn.48xlarge`, `r8gn.metal-48x1`, you must attach at least 2 ENIs, to separate network cards, to achieve 600 Gbps throughput. Each ENI attached to a network card can achieve up to 300 Gbps.

Amazon EBS specifications

The following table indicates which instance types are Amazon EBS optimized by default and which optionally support it. It also describes their EBS-optimized performance, including dedicated bandwidth to Amazon EBS, the typical maximum aggregate throughput that can be achieved on that dedicated connection with a streaming read workload and 128 KiB I/O size, and the maximum IOPS the instance type can support when using a 16 KiB I/O size. Instance types not listed do not support Amazon EBS optimization.

Important

An instance's EBS performance is bounded by the instance's performance limits, or the aggregated performance of its attached volumes, whichever is smaller. To achieve maximum EBS performance, an instance must have attached volumes that provide a combined performance equal to or greater than the maximum instance performance. For example, to achieve 80,000 IOPS for `r6i.16xlarge`, the instance must have at least 5 gp3 volumes provisioned with 16,000 IOPS each (5 volumes x 16,000 IOPS = 80,000 IOPS).

We recommend that you choose an EBS–optimized instance type that provides more dedicated Amazon EBS throughput than your application needs; otherwise, the connection between Amazon EBS and Amazon EC2 can become a performance bottleneck.

Note

- R8a, R8g, R8gd, R8i, R8i-flex, X8g, X8aedz virtualized instance types support configurable bandwidth weightings. With these instance types, you can optimize an instance's bandwidth for either networking performance or Amazon EBS performance. The following table shows the default networking bandwidth performance for these instance types. Bare metal instance types are not supported. For the supported configurable weightings, see [Configurable bandwidth weighting preferences](#).
- For maximum IOPS performance with U7i instances, we recommend that you use io2 BlockExpress volumes.

 **Note**

¹ These instances can support maximum performance for 30 minutes at least once every 24 hours, after which they revert to their baseline performance. Other instances can sustain the maximum performance indefinitely. If your workload requires sustained maximum performance for longer than 30 minutes, use one of these instances.

Instance store specifications

The following table shows the instance store volume configuration for supported instance types, along with the aggregated IOPS performance with 4,096 byte block size at queue depth saturation.

Specifications for Amazon EC2 storage optimized instances

Storage optimized instances are designed for workloads that require high, sequential read and write access to very large data sets on local storage. They are optimized to deliver tens of thousands of low-latency, random I/O operations per second (IOPS) to applications.

For information on previous generation instance types of this category, such as I2 instances, see [Specifications for Amazon EC2 previous generation instances](#).

 **Note**

¹ These instances have a baseline bandwidth and can use a network I/O credit mechanism to burst beyond their baseline bandwidth on a best effort basis. Other instance types

can sustain their maximum performance indefinitely. For more information, see [instance network bandwidth](#).

² These instances support enhanced networking using the Intel 82599 VF interface.

Amazon EBS specifications

The following table indicates which instance types are Amazon EBS optimized by default and which optionally support it. It also describes their EBS-optimized performance, including dedicated bandwidth to Amazon EBS, the typical maximum aggregate throughput that can be achieved on that dedicated connection with a streaming read workload and 128 KiB I/O size, and the maximum IOPS the instance type can support when using a 16 KiB I/O size. Instance types not listed do not support Amazon EBS optimization.

Important

An instance's EBS performance is bounded by the instance's performance limits, or the aggregated performance of its attached volumes, whichever is smaller. To achieve maximum EBS performance, an instance must have attached volumes that provide a combined performance equal to or greater than the maximum instance performance. For example, to achieve 80,000 IOPS for r6i.16xlarge, the instance must have at least 5 gp3 volumes provisioned with 16,000 IOPS each (5 volumes x 16,000 IOPS = 80,000 IOPS).

We recommend that you choose an EBS-optimized instance type that provides more dedicated Amazon EBS throughput than your application needs; otherwise, the connection between Amazon EBS and Amazon EC2 can become a performance bottleneck.

 **Note**

¹ These instances can support maximum performance for 30 minutes at least once every 24 hours, after which they revert to their baseline performance. Other instances can sustain the maximum performance indefinitely. If your workload requires sustained maximum performance for longer than 30 minutes, use one of these instances.

Instance store specifications

The following table shows the instance store volume configuration for supported instance types, along with the aggregated IOPS performance with 4,096 byte block size at queue depth saturation.

Specifications for Amazon EC2 accelerated computing instances

Accelerated computing instances use hardware accelerators, or co-processors, to perform functions, such as floating point number calculations, graphics processing, or data pattern matching, more efficiently than is possible in software running on CPUs.

For information on previous generation instance types of this category, such as G3 instances, see [Specifications for Amazon EC2 previous generation instances](#).

Note

¹ These instances have a baseline bandwidth and can use a network I/O credit mechanism to burst beyond their baseline bandwidth on a best effort basis. Other instance types can sustain their maximum performance indefinitely. For more information, see [instance network bandwidth](#).

Amazon EBS specifications

The following table indicates which instance types are Amazon EBS optimized by default and which optionally support it. It also describes their EBS-optimized performance, including dedicated bandwidth to Amazon EBS, the typical maximum aggregate throughput that can be achieved on that dedicated connection with a streaming read workload and 128 KiB I/O size, and the maximum IOPS the instance type can support when using a 16 KiB I/O size. Instance types not listed do not support Amazon EBS optimization.

⚠ Important

An instance's EBS performance is bounded by the instance's performance limits, or the aggregated performance of its attached volumes, whichever is smaller. To achieve maximum EBS performance, an instance must have attached volumes that provide a combined performance equal to or greater than the maximum instance performance. For example, to achieve 80,000 IOPS for r6i.16xlarge, the instance must have at least 5 gp3 volumes provisioned with 16,000 IOPS each (5 volumes x 16,000 IOPS = 80,000 IOPS).

We recommend that you choose an EBS-optimized instance type that provides more dedicated Amazon EBS throughput than your application needs; otherwise, the connection between Amazon EBS and Amazon EC2 can become a performance bottleneck.

 **Note**

¹ These instances can support maximum performance for 30 minutes at least once every 24 hours, after which they revert to their baseline performance. Other instances can sustain the maximum performance indefinitely. If your workload requires sustained maximum performance for longer than 30 minutes, use one of these instances.

Instance store specifications

Specifications for Amazon EC2 high-performance computing instances

High-performance computing instances are purpose built to offer the best price performance for running HPC workloads at scale on AWS. These instances are ideal for applications that benefit from high-performance processors, such as large, complex simulations and deep learning workloads.

Note

For hpc6id.32xlarge, you must attach at least 2 ENIs, to separate network cards, to achieve 200 Gbps throughput. Each ENI attached to a network card can achieve up to 170 Gbps.

For hpc7a.12xlarge, hpc7a.24xlarge, hpc7a.48xlarge, hpc7a.96xlarge, you must attach at least 2 ENIs, to separate network cards, to achieve 300 Gbps throughput. Each ENI attached to a network card can achieve up to 150 Gbps.

Amazon EBS specifications

The following table indicates which instance types are Amazon EBS optimized by default and which optionally support it. It also describes their EBS-optimized performance, including dedicated bandwidth to Amazon EBS, the typical maximum aggregate throughput that can be achieved on that dedicated connection with a streaming read workload and 128 KiB I/O size, and the maximum IOPS the instance type can support when using a 16 KiB I/O size. Instance types not listed do not support Amazon EBS optimization.

Important

An instance's EBS performance is bounded by the instance's performance limits, or the aggregated performance of its attached volumes, whichever is smaller. To achieve maximum EBS performance, an instance must have attached volumes that provide a combined performance equal to or greater than the maximum instance performance. For example, to achieve 80,000 IOPS for r6i.16xlarge, the instance must have at least 5 gp3 volumes provisioned with 16,000 IOPS each ($5 \text{ volumes} \times 16,000 \text{ IOPS} = 80,000 \text{ IOPS}$).

We recommend that you choose an EBS-optimized instance type that provides more dedicated Amazon EBS throughput than your application needs; otherwise, the connection between Amazon EBS and Amazon EC2 can become a performance bottleneck.

 **Note**

¹ These instances can support maximum performance for 30 minutes at least once every 24 hours, after which they revert to their baseline performance. Other instances can sustain the maximum performance indefinitely. If your workload requires sustained maximum performance for longer than 30 minutes, use one of these instances.

Instance store specifications

The following table shows the instance store volume configuration for supported instance types, along with the aggregated IOPS performance with 4,096 byte block size at queue depth saturation.

Specifications for Amazon EC2 previous generation instances

AWS offers previous generation instance types for users who have optimized their applications around them and have yet to upgrade. We encourage you to use current generation instance types to get the best performance, but we continue to support the following previous generation instance types.

 **Note**

¹ These instances have a baseline bandwidth and can use a network I/O credit mechanism to burst beyond their baseline bandwidth on a best effort basis. Other instance types can sustain their maximum performance indefinitely. For more information, see [instance network bandwidth](#).

² These instances support enhanced networking using the Intel 82599 VF interface.

Amazon EBS specifications

The following table indicates which instance types are Amazon EBS optimized by default and which optionally support it. It also describes their EBS-optimized performance, including dedicated bandwidth to Amazon EBS, the typical maximum aggregate throughput that can be achieved on that dedicated connection with a streaming read workload and 128 KiB I/O size, and the maximum IOPS the instance type can support when using a 16 KiB I/O size. Instance types not listed do not support Amazon EBS optimization.

 **Important**

An instance's EBS performance is bounded by the instance's performance limits, or the aggregated performance of its attached volumes, whichever is smaller. To achieve maximum EBS performance, an instance must have attached volumes that provide a combined performance equal to or greater than the maximum instance performance. For

example, to achieve 80,000 IOPS for `r6i.16xlarge`, the instance must have at least 5 `gp3` volumes provisioned with 16,000 IOPS each (5 volumes x 16,000 IOPS = 80,000 IOPS).

We recommend that you choose an EBS-optimized instance type that provides more dedicated Amazon EBS throughput than your application needs; otherwise, the connection between Amazon EBS and Amazon EC2 can become a performance bottleneck.

 **Note**

¹ These instances can support maximum performance for 30 minutes at least once every 24 hours, after which they revert to their baseline performance. Other instances can sustain the maximum performance indefinitely. If your workload requires sustained maximum performance for longer than 30 minutes, use one of these instances.

C1, C3, I2, M1, M2, M3, and R3 instances are not Amazon EBS optimized by default. You can optionally enable [Amazon EBS optimization](#) for these instances during or after launch for an additional hourly fee.

Amazon EC2 instance types by Region

An Amazon EC2 instance is tied to the zone in which it was launched. The ID of an instance is tied to the Region for the instance, and can only be used in this Region.

Considerations

- When you create your AWS account, we set default quotas on these resources on a per-Region basis. We monitor your usage within each Region and raise your quotas automatically based on your use of Amazon EC2. For more information, see [Quotas](#).
- Each Region supports a subset of the available instance types. An instance type that is supported in a Region might not be supported in all of the Availability Zones for that Region.
- Each Local Zone supports a subset of the available instance types. For more information, see [AWS Local Zones Features](#).
- Each Wavelength Zone supports a subset of the available instance types. For more information, see [Amazon EC2 considerations](#).

Instances built on the AWS Nitro System

End of sale notice

The **U-9tb1**, **U-12tb1**, **U-18tb1**, and **U-24tb1** instance types are no longer available for new instance launches. If your workload requires a high-memory instance, we recommend that you use a U7i instance type instead.

The Nitro System is a collection of hardware and software components built by AWS that enable high performance, high availability, and high security.

The Nitro System provides bare metal capabilities that eliminate virtualization overhead and support workloads that require full access to host hardware. Bare metal instances are well suited for the following:

- Workloads that require access to low-level hardware features (for example, Intel VT) that are not available or fully supported in virtualized environments
- Applications that require a non-virtualized environment for licensing or support

Nitro components

The following components are part of the Nitro System:

- Nitro card
 - Local NVMe storage volumes
 - Networking hardware support
 - Management
 - Monitoring
 - Security
- Nitro security chip, integrated into the motherboard
- Nitro hypervisor - A lightweight hypervisor that manages memory and CPU allocation and delivers performance that is indistinguishable from bare metal for most workloads.

For more information, see [AWS Nitro System](#).

Network feature support

The following content summarizes key networking capabilities for each version of the Nitro System. Versions are shown in descending version release order. If you know the instance type family that your instance belongs to, you can expand the [Specifications](#) section and select your instance family. The **Platform summary** table for your instance family shows the Nitro version for your instance type in the **Hypervisor** column.

If you're not sure which instance family applies, see the [Naming conventions](#) section.

Note

Features are cumulative, meaning that newer versions of the Nitro system support the features that are listed in all prior versions, except where explicitly stated otherwise.

See the [Nitro instance requirements](#) section for the minimum ENA driver and Linux kernel versions for optimal performance of Nitro v4 and later instance types.

Nitro v6

- Traffic Mirroring is not supported.
- Up to 400 Gbps^{*} per network card.

Nitro v5

- Traffic Mirroring is not supported.
- Up to 200 Gbps^{*} per network card.

Nitro v4

- GPU accelerated and Trainium based instance types support up to 100 Gbps^{*} per network card for consistency. Other instance types support up to 170 Gbps^{*} per network card.
- Supports ENA Express. For more information about ENA Express, including what specific instance types support it see [Improve network performance with ENA Express on your EC2 instances](#) in the *Amazon EC2 User Guide*.
- Supports RDMA read and RDMA write for select instance types. For more information, see [Elastic Fabric Adapter](#).

- Traffic Mirroring is supported.

Nitro v3

- Up to 100 Gbps^{*} per network card.
- Encryption in transit.
- Traffic Mirroring is supported.

Nitro v2

- Enhanced networking with Elastic Network Adapter (ENA).
- Traffic Mirroring is supported.

^{*} Your instance type might support a lower maximum bandwidth. For more information, refer to the network specifications for your instance type in the instance family pages.

Virtualized instances

In most cases, when you launch a bare metal instance, the underlying server goes through its boot process, during which it verifies all hardware and firmware components. This means that it can take up to 20 minutes or more from the time the instance enters the running state until it becomes available over the network.

Nitro instance requirements

Instances built on the AWS Nitro System use ENA for enhanced networking, and storage volumes exposed as NVMe block devices. For more information about NVMe drivers, see [Install or upgrade the NVMe driver in the Amazon EBS User Guide](#) for Linux instances, or [AWS NVMe drivers for Windows instances](#) in the [Amazon EC2 User Guide](#). For more information about ENA drivers, see [Requirements for enhanced networking with ENA](#) in the [Amazon EC2 User Guide](#).

The following tabs show details about which driver or kernel versions are recommended for your operating system.

Linux

The ENA Linux kernel driver version 2.2.9g or later, from the Amazon Drivers GitHub repository is recommended for Nitro v4 instance types and required for Nitro v5 (or later) instance types for Linux distributions that expose the version information. ENA drivers for Linux are available on GitHub. For more information, see [Linux kernel driver for Elastic Network Adapter \(ENA\) family](#). For release notes, see [ENA Linux Kernel Driver Release notes](#).

Linux distributions can also incorporate ENA driver features within the kernel. However, the timing may vary for implementation within the different distributions. The Amazon Linux 2023 and Bottlerocket Linux distributions support ENA features for Nitro v4 and newer instance types by default.

Some Linux distributions might require a minimum kernel version to prevent suboptimal performance of ENA driver features on Nitro v4 and newer instance types. If your Linux

distribution appears in the following table, you can verify the kernel version for your instance with the **uname** command as follows:

```
uname -r
```

Linux distribution	Minimum kernel version
Linux upstream	Kernel version 5.9
Amazon Linux 2	Kernel 4.14.186
Red Hat Enterprise Linux (RHEL)	RHEL 8.4 kernel 4.18.0-305
SUSE Linux Enterprise Server (SLES)	<ul style="list-style-type: none">SLE 12 SP4 kernel 4.12.14-95.99.3SLE 12 SP5 kernel 4.12.14-122.116.1SLE 15 kernel 4.12.14-150000.150.92.2SLE 15 SP1 kernel 4.12.14-150100.197 .114.2SLE 15 SP2 kernel 5.3.18-24.15.1
Linux Ubuntu	20.04 kernel 5.4.0-1025-aws
Debian	11 (Bullseye) kernel 5.10.0
DPDK	v20.11

Note

The following ENA Linux driver versions are not supported, and will result in elastic network interface attachment failures:

- ENA Linux

- Nitro v5 – Earlier than 2.2.9
- All Nitro versions prior to v5 – Earlier than v1.2.0
- ENA DPDK
 - Nitro v5 – Earlier than 20.11
 - All Nitro versions prior to v5 – Earlier than v1.1.1

Windows

ENA Windows driver version: 2.2.3 or later for Windows instances.

 **Note**

The following ENA Windows drivers are not supported:

- ENA Windows: v2.2.0 or earlier

All of the current AWS Windows AMIs meet these requirements. For more information about AMI versions and release notes, see the [AWS Windows AMI reference](#).

FreeBSD

ENA FreeBSD driver version: 2.3.1 or later for FreeBSD instances.

 **Note**

ENA FreeBSD driver versions earlier than v2.3.1 are not supported, and will result in elastic network interface attachment failures.

Linux instances with AWS Graviton processors

Linux instances with AWS Graviton processors have the following additional requirements:

- An AMI with 64-bit ARM architecture.
- Support for UEFI boot with ACPI tables and ACPI hot-plug of PCI devices.

Note

AWS Graviton processors only support Linux operating systems.

Amazon EC2 instance type quotas

Your AWS account has quotas that affect the number of instances that you can run in each Region. These quotas are grouped by purchasing option.

Quotas

- [On-Demand Instance quotas](#)
- [Spot Instance quotas](#)
- [Dedicated Host quotas](#)
- [Capacity Blocks quotas](#)

On-Demand Instance quotas

The following table shows the maximum number of vCPUs that you can provision for On-Demand Instances. Amazon EC2 automatically increases your On-Demand Instance quotas based on your usage. You can also request a quota increase. For more information, see [On-Demand Instance quotas](#) in the *Amazon EC2 User Guide*.

Name	Default	Adjustable
Running On-Demand DL instances	0	Yes
Running On-Demand F instances	0	Yes
Running On-Demand G and VT instances	0	Yes
Running On-Demand HPC instances	0	Yes
Running On-Demand High Memory instances	0	Yes
Running On-Demand Inf instances	0	Yes
Running On-Demand P instances	0	Yes
Running On-Demand Standard (A, C, D, H, I, M, R, T, Z) instances	5	Yes

Name	Default	Adjustable
Running On-Demand Trn instances	0	Yes
Running On-Demand X instances	0	Yes

Spot Instance quotas

The following table shows the maximum number of vCPUs that you can provision for Spot Instances. Amazon EC2 automatically increases your Spot Instance quotas based on your usage. You can also request a quota increase. For more information, see [Spot Instance quotas](#) in the *Amazon EC2 User Guide*.

Name	Default	Adjustable
All DL Spot Instance Requests	0	Yes
All F Spot Instance Requests	0	Yes
All G and VT Spot Instance Requests	0	Yes

Document history for the Amazon EC2 Instance Types Guide

The following table describes the instance type releases for Amazon EC2.

Change	Description	Date
<u>M8gn instances</u>	New general purpose instances types powered by AWS Graviton4 processors and the AWS Nitro v6 card. These instance types feature improved network performance, with up to 600 Gbps network throughput.	December 17, 2025
<u>M8gb instances</u>	New general purpose instances types powered by AWS Graviton4 processors and the AWS Nitro v6 card. These instance types provide improved Amazon EBS performance, with up to 150 Gbps EBS throughput and 720,00 IOPS.	December 17, 2025
<u>C8gb instances</u>	New compute optimized instance types powered by AWS Graviton4 processors, and that deliver up to 150 Gbps Amazon EBS throughput.	December 10, 2025
<u>X8aedz instances</u>	New memory optimized instance types powered by fifth generation AMD EPYC	December 2, 2025

	Processors (Turin), with a maximum CPU frequency of 5 GHz, up to 3072 GiB of memory, and up to 7600 GB of NVMe SSD instance storage.	
<u>C8a instances</u>	New compute optimized instance types powered by fifth generation AMD EPYC Processors (Turin), with a maximum CPU frequency of 4.5 GHz, and up to 384 GiB of memory.	December 2, 2025
<u>P6-B300 instances</u>	Latest generation GPU instances featuring Nvidia B300 GPUs for large scale ML training, Inference and HPC workloads.	November 18, 2025
<u>R8a instances</u>	New memory optimized instance types powered by fifth generation AMD EPYC Processors (Turin), with a maximum CPU frequency of 5 GHz, and up to 1,536 GiB of memory.	November 4, 2025
<u>M8a instances</u>	New general purpose instance types powered by fifth generation AMD EPYC Processors (Turin) with a maximum CPU frequency of 4.5 GHz.	October 8, 2025

<u>C8i-flex instances</u>	New compute optimized Flex instances that feature custom sixth generation Intel Xeon Scalable Processors (Granite Rapids). Flex instances deliver a baseline CPU performance of 40 percent with the ability to deliver up to 100 percent CPU performance for 95 percent of the time over a 24-hour period.	October 6, 2025
<u>C8i instances</u>	New compute optimized instance types that feature custom sixth generation Intel Xeon Scalable Processors (Granite Rapids).	October 6, 2025
<u>Updated network performance for I7i and I8g</u>	I7i and I8g instance types .8xlarge and larger no longer use the network I/O credit mechanism to burst beyond their baseline bandwidth. They now sustain their maximum performance indefinitely.	September 24, 2025
<u>R8gb instances</u>	New memory optimized instance types powered by AWS Graviton4 processors, and that feature improved Amazon EBS performance with up to 300 Gbps EBS throughput and 1,440,000 IOPS.	September 23, 2025

<u>R8gn instances</u>	New memory optimized instance types powered by AWS Graviton4 processors, and that feature up to 1536 GiB of memory.	September 15, 2025
<u>M4 Pro Mac instances</u>	New general purpose Mac instances built on 2024 Mac mini hardware powered by Apple silicon M4 Pro processors, 14 CPU cores, 20 GPU cores, 48 GiB of memory, and the 16-core Apple Neural Engine.	September 11, 2025
<u>M4 Mac instances</u>	New general purpose Mac instances built on 2024 Mac mini hardware powered by Apple silicon M4 processors, 10 CPU cores, 10 GPU cores, 24 GiB of memory, and the 16-core Apple Neural Engine.	September 11, 2025
<u>I8ge instances</u>	New storage optimized instance family based on the latest third generation AWS Nitro SSDs and AWS Graviton4 Processor. I8ge offers up to 192 vCPUs, 1536 GB memory, and up to 120TB storage. I8ge instances are optimized for storage intensive workloads such as NoSQL databases, distributed file systems, search engines, and data analytics.	August 29, 2025

<u>M8i-flex instances</u>	New general purpose Flex instances that feature custom sixth generation Intel Xeon Scalable Processors (Granite Rapids). Flex instances deliver a baseline CPU performance of 40 percent with the ability to deliver up to 100 percent CPU performance for 95 percent of the time over a 24-hour period.	August 28, 2025
<u>M8i instances</u>	New general purpose instance types that feature custom sixth generation Intel Xeon Scalable Processors (Granite Rapids).	August 28, 2025
<u>R8i-flex instances</u>	New memory optimized Flex instances that feature custom sixth generation Intel Xeon Scalable Processors (Granite Rapids) and up to 512 GiB of memory. Flex instances deliver a baseline CPU performance of 40 percent with the ability to deliver up to 100 percent CPU performance for 95 percent of the time over a 24-hour period.	August 19, 2025

<u>R8i instances</u>	New memory optimized instance types that feature custom sixth generation Intel Xeon Scalable Processors (Granite Rapids) and up to 3 TiB of memory.	August 19, 2025
<u>P5 instance new size</u>	New p5.4xlarge instance type enables smaller size with one GPU.	August 12, 2025
<u>G6f, Gr6f instances</u>	New G6f and Gr6f instance types can lower GPU computing costs by offering fractional GPU profiles that better match your workload requirements, making GPU-accelerated workstations and graphics applications more cost-effective for use cases that don't require full GPU capacity.	July 29, 2025
<u>P6e-GB200 instances</u>	New GPU instances featuring NVIDIA GB200 superchip s for the highest available GPU-based AI training and inference performance.	July 10, 2025
<u>C8gn instances</u>	New compute optimized instances types powered by AWS Graviton4 processors, and that support up to to 600 Gbps networking.	June 30, 2025

<u>U-9tb1, U-12tb1, U-18tb1, and U-24tb1 end of sale</u>	The U-9tb1, U-12tb1, U-18tb1, and U-24tb1 instance types are no longer available for new instance launches. If your workload requires a high-memory instance, we recommend that you use a U7i instance type instead.	June 20, 2025
<u>P6-B200 instances</u>	New GPU instances featuring NVIDIA B200 GPUs for large scale ML Training/inference and HPC.	May 15, 2025
<u>I7i instances</u>	New storage optimized virtualized and bare metal instance types that feature Intel Emerald Rapids processors and third generation AWS Nitro SSD-based instance storage.	April 25, 2025
<u>M8gd, C8gd, R8gd instances</u>	New general purpose (M8gd), compute optimized (C8gd), and memory optimized (R8gd) virtualized and bare metal instances powered by AWS Graviton4 processors, and that feature NVMe SSD instance storage.	April 21, 2025

<u>i7ie bare metal instances</u>	New i7ie.metal-24x1 and i7ie.metal-48x1 bare metal instance types that feature the 5th generation Intel Xeon Scalable processors (Emerald Rapids), and the 3rd generation AWS Nitro SSDs.	April 10, 2025
<u>GovCloud now supports R8g</u>	The GovCloud Regions now support the R8g instance type.	March 31, 2025
<u>GovCloud now supports R8g</u>	The GovCloud Regions now support the R8g instance type.	March 31, 2025
<u>New F2 instance type</u>	F2 is now available in the following instance size: 6xlarge.	February 5, 2025
<u>New C7i-flex and M7i-flex instance types</u>	C7i-flex and M7i-flex are now available in 12xlarge and 16xlarge instance sizes.	January 16, 2025
<u>U7inh-32tb instances</u>	New high memory instance types that feature 1,920 vCPUs of 4th generation Intel Xeon Scalable Processors (Sapphire Rapids) with 32 TiB of memory.	December 16, 2024

<u>F2 instances</u>	New accelerated computing instance type for the latest generation FPGA instances that feature AMD-Xilinx VU47P HBM FPGA accelerators for genomics and multimedia processing.	December 11, 2024
<u>U7i-6tb, and U7i-8tb instances</u>	New high memory instance types that feature 4th generation Intel Xeon Scalable processors.	December 9, 2024
<u>Trn2 instances</u>	New accelerated instance types that feature up to 16x Trainium2 chips and deliver up to 4 times faster performance than Trn1 instances.	December 3, 2024
<u>P5en instances</u>	GPU instances featuring NVIDIA H200 GPUs for large scale ML Training/inference and HPC.	December 2, 2024
<u>I8g instances</u>	New storage optimized instances powered by AWS Graviton4 processors.	December 1, 2024
<u>I7ie instances</u>	New storage optimized instances that feature the 5th generation Intel Xeon Scalable processors (Emerald Rapids), and the 3rd generation AWS Nitro SSDs.	December 1, 2024

<u>M8g instances</u>	New general purpose instances powered by AWS Graviton4 processors.	September 25, 2024
<u>C8g instances</u>	New compute optimized instances powered by AWS Graviton4 processors.	September 25, 2024
<u>X8g instances</u>	New memory optimized instances powered by AWS Graviton4 processors.	September 18, 2024
<u>P5e instances</u>	New accelerated computing instance type for the latest generation GPU instances featuring NVIDIA H200 GPUs for large scale ML Training/inference and HPC.	September 9, 2024
<u>G6e instances</u>	New accelerated computing instances that feature up to 8 NVIDIA L40S GPUs, which offer 48 GB of GPU memory.	August 15, 2024
<u>Nitro version features</u>	Updated Nitro page to include features and instance types by Nitro version. Added Nitro version to the Hypervisor column in the Platform summary tables also.	July 22, 2024
<u>R8g instances</u>	New memory optimized instances powered by AWS Graviton4 processors and up to 1.5 TiB memory.	July 9, 2024

<u>Mac2-m1ultra instances</u>	New general purpose instance type that features Apple M1 Ultra processors.	June 17, 2024
<u>U7i-12tb, U7in-16tb, U7in-24tb, and U7in-32tb instances</u>	New high memory instance types that feature 4th generation Intel Xeon Scalable processors.	May 28, 2024
<u>C7i-flex instances</u>	New compute optimized instances featuring Intel Xeon Scalable processors (Sapphire Rapids). They deliver a baseline CPU performance of 40 percent with the ability to deliver up to 100 percent CPU performance for 95 percent of the time over a 24-hour period.	May 14, 2024
<u>G6 and Gr6 instances</u>	New high performance GPU-based instance types for deep learning inference and graphics-intensive applications.	April 4, 2024
<u>C7gn bare metal instances</u>	New c7gn.metal bare metal instance type powered by the latest generation AWS Graviton3E processors and the new AWS Nitro cards.	March 26, 2024
<u>C7gd, M7gd, and R7gd bare metal instances</u>	New bare metal instances.	March 6, 2024

<u>DL2q instances</u>	New instances that use Qualcomm AI100 inference accelerators, which feature 7th generation Qualcomm Edge AI cores. These instances can be used to cost-efficiently deploy deep learning (DL) workloads in the cloud or validate performance and accuracy of DL workloads that will be deployed on Qualcomm edge devices.	November 15, 2023
<u>Mac2-m2 instances</u>	New general purpose instance type that features Apple M2 processors.	October 25, 2023
<u>R7i instances</u>	New memory optimized instance types that feature 4th generation Intel Xeon Scalable processors.	October 16, 2023
<u>C7a instances</u>	New compute optimized instances powered by 4th generation AMD EPYC processors.	October 4, 2023
<u>Mac2-m2pro instances</u>	New general purpose instance type that features Apple M2 Pro processors.	September 18, 2023
<u>C7i instances</u>	New compute optimized instance types that feature 4th generation Intel Xeon Scalable processors.	September 14, 2023

<u>R7a instances</u>	New memory optimized instance types featuring 4th generation AMD EPYC 9R14 processors and up to 1536 GiB of system memory.	September 11, 2023
<u>R7iz instances</u>	New high-frequency and high memory instances powered by 4th generation Intel Xeon processors.	September 7, 2023
<u>Hpc7a instances</u>	New compute optimized instance types that feature 4th generation AMD EPYC processors. These instances support up to 300 Gbps networking bandwidth, and up to 192 CPU cores with up to 768 GB of system memory.	August 17, 2023
<u>M7a instances</u>	New general purpose instances powered by 4th generation AMD EPYC processors.	August 15, 2023
<u>M7i-flex instances</u>	New general purpose instances that offer a balance of compute, memory, and network resources for a broad spectrum of general purpose applications. They deliver a baseline CPU performance of 40 percent with the ability to deliver up to 100 percent CPU performance for 95 percent of the time over a 24-hour period.	August 2, 2023

<u>M7i instances</u>	New general purpose instance types that feature 4th generation Intel Xeon Scalable processors.	August 2, 2023
<u>R7gd instances</u>	New memory optimized instances featuring the latest AWS Graviton3 processors.	July 28, 2023
<u>M7gd instances</u>	New general purpose instances featuring the latest AWS Graviton3 processors.	July 28, 2023
<u>C7gd instances</u>	New compute optimized instances featuring the latest AWS Graviton3 processors.	July 28, 2023
<u>P5 instances</u>	New accelerated computing instances that feature 8 NVIDIA H100 GPUs with 640 GB high-bandwidth GPU memory, 3rd generation AMD EPYC processors, and 2 TB system memory.	July 26, 2023
<u>Hpc7g instances</u>	New high-performance computing instances powered by AWS Graviton3E processors that provide up to 35 percent higher vector-instruction processing performance than Graviton3 processors.	June 20, 2023

<u>C7gn instances</u>	New compute optimized instances powered by the latest generation AWS Graviton3E processors and the new AWS Nitro cards. These instances offer up to 200 Gbps network bandwidth.	June 20, 2023
<u>I4g instances</u>	New storage optimized instances that features the AWS Graviton2 processor and AWS Nitro SSDs.	May 9, 2023
<u>Trn1n instances</u>	New accelerated computing instances optimized for machine learning training powered by AWS Trainium accelerators.	April 13, 2023
<u>Inf2 instances</u>	New instances featuring AWS Inferentia2 accelerators, the latest machine learning chip designed by AWS.	April 13, 2023
<u>M7g and R7g instances</u>	New instances featuring AWS Graviton3 processors.	February 12, 2023
<u>Hpc6id instance</u>	New memory optimized instance featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	November 29, 2022
<u>R6in and R6idn instances</u>	New memory optimized instances for network-intensive workloads.	November 28, 2022
<u>M6in and M6idn instances</u>	New general computing instances types.	November 28, 2022

<u>C6in instances</u>	New compute optimized instances ideal for running high performance computing.	November 28, 2022
<u>Trn1 instances</u>	New accelerated computing instances optimized for deep learning powered by AWS Trainium chips.	October 10, 2022
<u>R6a instances</u>	New memory optimized instances featuring 3rd generation AMD EPYC processors.	July 19, 2022
<u>R6id instances</u>	New memory optimized instances featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	June 9, 2022
<u>P4de instances</u>	New accelerated computing instances featuring 640GB of GPU memory.	May 26, 2022
<u>M6id instances</u>	New general purpose instances featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	May 26, 2022
<u>C6id instances</u>	New compute optimized instances featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	May 26, 2022
<u>C7g instances</u>	New compute optimized instances featuring AWS Graviton3 processors.	May 23, 2022

<u>I4i instances</u>	New storage optimized instances featuring 3rd generation Intel Xeon Scalable processors (Ice Lake).	April 27, 2022
<u>X2idn and X2iedn instances</u>	New memory optimized instances featuring Intel Xeon Scalable processors (Ice Lake).	March 10, 2022
<u>C6a instances</u>	New compute optimized instances featuring 3rd generation AMD EPYC processors (Milan).	February 14, 2022
<u>X2iezn instances</u>	New memory optimized instances featuring Intel Xeon Platinum processors (Cascade Lake).	January 26, 2022
<u>Hpc6a instances</u>	New compute optimized instances featuring AMD EPYC processors.	January 10, 2022
<u>Im4gn and Is4gen instances</u>	New storage optimized instances.	November 30, 2021
<u>M6a instances</u>	New general purpose instances powered by AMD 3rd Generation EPYC processors.	November 29, 2021
<u>G5g instances</u>	New accelerated computing instances featuring AWS Graviton2 processors based on 64-bit Arm architecture.	November 29, 2021
<u>R6i instances</u>	New memory optimized instances.	November 22, 2021

<u>G5 instances</u>	New accelerated computing instances featuring up to 8 NVIDIA A10G GPUs and second generation AMD EPY processors.	November 11, 2021
<u>C6i instances</u>	New compute optimized instances featuring Intel Xeon Scalable processors (Ice Lake).	October 28, 2021
<u>DL1 instances</u>	New accelerated computing instances featuring Habana Gaudi accelerators and Intel Xeon Platinum processors (Cascade Lake).	October 26, 2021
<u>VT1 instances</u>	New accelerated computing instances that use Xilinx Alveo U30 media accelerators and are designed for live video transcoding workloads.	September 13, 2021
<u>M6i instances</u>	New general purpose instances featuring third generation Intel Xeon Scalable processors (Ice Lake).	August 16, 2021
<u>High memory virtualized instances</u>	Virtualized high memory instances purpose-built to run large in-memory databases. The new types are u-6tb1.56xlarge, u-6tb1.112xlarge, u-9tb1.112xlarge, and u-12tb1.112xlarge.	May 11, 2021

<u>X2gd instances</u>	New memory optimized instances featuring an AWS Graviton2 processor based on 64-bit Arm architecture.	March 16, 2021
<u>C6gn instances</u>	New computed optimized instances featuring an AWS Graviton2 processor based on 64-bit Arm architecture. These instances can utilize up to 100 Gbps of network bandwidth.	December 18, 2020
<u>G4ad instances</u>	New instances powered by AMD Radeon Pro V520 GPUs and AMD 2nd Generation EPYC processors.	December 9, 2020
<u>D3, D3en, M5zn, and R5b instances</u>	New instance types built on the Nitro System.	December 1, 2020
<u>Mac1 instances</u>	New instances built on Apple Mac mini computers that support running macOS workloads on Amazon EC2.	November 30, 2020
<u>P4d instances</u>	New accelerated computing instances that provide a high-performance platform for machine learning and HPC workloads.	November 2, 2020

<u>T4g instances</u>	New general purpose instances powered by AWS Graviton2 processors, which are based on 64-bit Arm Neoverse cores and custom silicon designed by AWS for optimized performance and cost.	September 14, 2020
<u>C5ad instances</u>	New compute optimized instances featuring second-generation AMD EPYC processors.	August 13, 2020
<u>C6gd, M6gd, and R6gd instances</u>	New general purpose instances powered by AWS Graviton2 processors, which are based on 64-bit Arm Neoverse cores and custom silicon designed by AWS for optimized performance and cost.	July 27, 2020
<u>C6g and R6g instances</u>	New general purpose instances powered by AWS Graviton2 processors, which are based on 64-bit Arm Neoverse cores and custom silicon designed by AWS for optimized performance and cost.	June 10, 2020
<u>C5a instances</u>	New compute optimized instances featuring second-generation AMD EPYC processors.	June 4, 2020

<u>M6g instances</u>	New general purpose instances powered by AWS Graviton2 processors, which are based on 64-bit Arm Neoverse cores and custom silicon designed by AWS for optimized performance and cost.	May 11, 2020
<u>Inf1 instances</u>	New instances featuring AWS Inferentia, a machine learning inference chip designed to deliver high performance at a low cost.	December 3, 2019
<u>M5dn, M5n, R5dn, and R5n instances</u>	New instances featuring 100 Gbps of network bandwidth.	October 9, 2019
<u>G4dn instances</u>	New instances featuring NVIDIA Tesla GPUs.	September 19, 2019
<u>I3en instances</u>	New I3en instances can utilize up to 100 Gbps of network bandwidth.	May 8, 2019
<u>T3a instances</u>	New instances featuring AMD EPYC processors.	April 24, 2019
<u>M5ad and R5ad instances</u>	New instances featuring AMD EPYC processors.	March 27, 2019
<u>p3dn.24xlarge instances</u>	New instances that provide 100 Gbps of network bandwidth.	December 7, 2018
<u>C5n instances</u>	New instances that provide up to 100 Gbps of network bandwidth.	November 26, 2018

<u>A1 instances</u>	New instances featuring Arm-based processors.	November 26, 2018
<u>R5a instances</u>	New instances featuring AMD EPYC processors.	November 6, 2018
<u>M5a instances</u>	New instances featuring AMD EPYC processors.	November 6, 2018
<u>T3 instances</u>	New instances featuring AMD EPYC processors.	August 21, 2018
<u>z1d instances</u>	New memory optimized instances.	July 25, 2018
<u>R5 and R5d instances</u>	New memory optimized instances.	July 25, 2018
<u>M5d instances</u>	New compute optimized instances.	June 4, 2018
<u>C5d instances</u>	New compute optimized instances.	May 17, 2018
<u>X1e instances</u>	New memory optimized instances.	November 28, 2017
<u>M5 instances</u>	New general purpose instances.	November 28, 2017
<u>H1 instances</u>	New storage optimized instances.	November 28, 2017
<u>C5 instances</u>	New compute optimized instances.	November 6, 2017
<u>P3 instances</u>	New accelerated computing instances.	October 25, 2017

<u>G3 instances</u>	New accelerated computing instances.	July 13, 2017
<u>F1 instances</u>	New accelerated computing instances.	April 19, 2017
<u>I3 instances</u>	New storage optimized instances.	February 23, 2017
<u>R4 instances</u>	New memory optimized instances.	November 30, 2016
<u>P2 instances</u>	New accelerated computing instances.	September 29, 2016
<u>X1 instances</u>	New memory optimized instances.	May 18, 2016
<u>M4 instances</u>	New general purpose instances.	June 11, 2015
<u>D2 instances</u>	New storage optimized instances.	March 24, 2015
<u>C4 instances</u>	New compute optimized instances.	January 11, 2015
<u>T2 instances</u>	New general purpose instances.	June 30, 2014
